OMNIX -- Presentation Script (Jose Salvador)

OMNIX Decision Governance Infrastructure | March 2026 | Confidential

OMNIX -- Presentation Script for Eureka Dubai

5-7 Minute Version | Simple English | March 2026

Instructions: Read this aloud slowly. Each section has a time marker. Practice until it feels natural. Short sentences. Pause between sections. Make eye contact.

OPENING -- THE HOOK (30 seconds)

"Ninety-five percent of automated decision systems ask one question:

When should I act?

That is the wrong question.

The right question is:

When should I NOT act?

Every year, billions of dollars are lost -- not because systems fail to act -- but because they act when they shouldn't.

In trading. In lending. In insurance. In supply chain.

Nobody builds infrastructure for restraint.

Until now."

THE PROBLEM (45 seconds)

"Let me explain the problem simply.

Today, automated systems execute constantly. Even in dangerous conditions. They have one risk check. Maybe two. And when the market turns -- they lose money.

Here is what's missing:

There is no institutional-grade decision governance available to most firms. The big hedge funds -- they built their own. In-house. Millions of dollars. Not available to anyone else.

Prop trading firms? They don't have it.
Trading platforms? They don't have it.
Regulated funds under MiCA? They need it -- and they don't have it.

That gap -- that is our market."

THE SOLUTION (45 seconds)

"OMNIX is a decision governance infrastructure.

Think of it like airport security -- for every high-stakes decision.

Every action must pass through six independent checkpoints. If ANY checkpoint fails -- the action is blocked. Automatically.

Checkpoint one: Is this trade likely to win? Run ten thousand simulations.
Checkpoint two: Does this exceed safe risk limits?
Checkpoint three: Do five independent AI models agree?
Checkpoint four: Is this trend sustained -- or just noise?
Checkpoint five: What if the market crashes right now?
Checkpoint six: Are the internal signals contradicting each other?

All six must approve. One fails -- blocked.

The default is: don't act. The system must earn the right to execute."

PROOF -- THE TRADE THAT DIDN'T HAPPEN (45 seconds)

"Let me show you this working in practice.

February third, twenty-twenty-six. Bitcoin breaks out. Up six percent in two hours. Market is euphoric. Every traditional bot is buying.

OMNIX ran its governance checkpoints -- this was February 2026, under the original six-checkpoint system. Five passed. One failed: trend confirmation. The system said: this momentum is not sustained. It blocked the trade.

Forty-eight hours later -- Bitcoin dropped nine percent.

A traditional bot would have lost forty-five hundred dollars. OMNIX exposure: zero.

Capital preserved: fifty thousand dollars.

This is not a failure. This is the product working exactly as designed."

TRACTION (45 seconds)

"OMNIX has been running in production -- real market conditions -- since November twenty-twenty-five.

Here are the numbers.

Ninety-eight point five percent of capital preserved -- during a period where Bitcoin dropped over seven percent.

Forty-seven signals blocked by the governance engine. Ninety-one percent validated against subsequent 48-hour price data -- those trades would have lost money. Internal dataset.

Six hundred seventy thousand evaluation cycles analyzed in our Shadow Portfolio learning engine. Sixteen thousand governance decisions cryptographically signed and publicly verifiable.

And every single trade is reconciled against real exchange data. We have one hundred percent P&L reconciliation across all one hundred nineteen trades. We call this Execution Integrity.

This is not backtesting. This is not simulation. This is live."

WHY ME (20 seconds)

"Three months. Personal capital. Lean, focused build. Governance-first architecture.

I chose the hardest domain first -- real-time financial markets. Not because it was easy. Because if the governance engine survives here, it survives anywhere.

That is not a slide. That is conviction."

TECHNOLOGY MOAT (30 seconds)

"Why is this hard to copy?

Six layers of technology. Built over three months of real-market operation.

A behavioral memory system that sees patterns beyond recent data. A Shadow Portfolio that learns from what the system does NOT do. Post-quantum cryptographic signing -- operational today. Multi-AI orchestration across three providers with zero single-point-of-failure.

And twenty-seven documented architecture decisions. Full audit trail. Everything traceable."

BUSINESS MODEL (45 seconds)

"Our primary market is B2B -- licensing governance infrastructure to institutions.

Prop trading firms: fifteen to thirty-five thousand dollars per month. We protect their traders' capital.

Trading platforms: risk-as-a-service. One to five cents per validation.

Regulated funds: annual license starting at one hundred thousand dollars for audit trail and compliance.

No tokens. No performance fees. Clean licensing.

Year one target: three enterprise pilots. Two hundred to four hundred thousand in revenue.
Year two: five to eight enterprise licenses. Eight hundred thousand to one point two million.
Year three: geographic expansion -- ADGM to EU under MiCA. Two million plus.

Institutions are not asking if they need governance. They are asking how soon they can implement it."

WHY DUBAI (20 seconds)

"Why here? Why now?

MiCA in Europe and ADGM in Dubai are creating mandatory demand for decision governance infrastructure -- not optional, mandatory. Two thousand plus platforms need compliance documentation.

Two hundred plus prop firms in ADGM and DIFC need governance infrastructure.

The regulatory window is open. This is the moment to establish the standard.

Dubai is not just our headquarters. It is our first market -- and the fastest path to institutional clients."

THE ASK (30 seconds)

"We are raising five hundred thousand dollars.

Sixteen point seven percent equity. Two point five to three million pre-money valuation.

Use of funds: thirty-five percent for the risk engine. Twenty-five percent for ADGM legal and regulatory setup. Twenty percent for enterprise infrastructure. Fifteen percent for two to three key hires -- eliminating key-person risk.

Milestone: three paying enterprise clients within nine months.

Series A readiness within twelve months -- with validated revenue."

CLOSE (15 seconds)

"Most decision systems ask: how do I maximize returns?

OMNIX asks: how do I make sure costly mistakes don't happen?

We validated this in the hardest domain first -- real-time financial markets. The same engine applies to lending, insurance, supply chain, and compliance.

The best decision is often the one you don't make.

That is what we build.

Thank you. I'm happy to take questions."

TIMING GUIDE

Section	Target Time	Cumulative
Opening Hook	0:30	0:30
The Problem	0:45	1:15
The Solution	0:45	2:00
Proof (BTC example)	0:45	2:45
Traction	0:45	3:30
Why Me	0:20	3:50
Technology Moat	0:30	4:20

6:20

Total: ~6:20 -- target range for Eureka 5-7 minute format. Adjust pace on Tech Moat and Business Model if time is tight.

DELIVERY TIPS

1. Speak slowly. You have time. Rushing kills credibility.
2. Pause after key numbers. "Ninety-eight point five percent." [pause] "Capital preserved."
3. Make eye contact with judges during the close and the ask.
4. Don't read. Know this by heart. The script is for practice, not for the stage.
5. If you forget a number, skip it and keep going. Momentum matters more than precision.
6. Stand still. Don't pace. Plant your feet.
7. Voice low and steady. Confidence comes from calm, not volume.
