

OMNIX -- Eureka Dubai Pitch

OMNIX Decision Governance Infrastructure | March 2026 | Confidential

OMNIX -- Eureka Dubai Pitch Deck

Final Competition Version | March 2026

Classification: Competition Ready -- Expert-Reviewed & Mentor-Optimized

Target: Eureka Dubai -- Semifinal Round

SLIDE 1 -- TITLE

OMNIX

Decision Governance Infrastructure

"The best decision is often the one you don't make."

Harold Nunes -- Founder & Product Architect

Pre-Seed | March 2026

contacto@omnixquantum.net | www.omnixquantum.net

SLIDE 2 -- THE PROBLEM (10-Second Hook)

The vast majority of high-stakes decision systems ask the wrong question.

They ask: "When should I act?"

The right question is:

"When should I NOT act?"

What happens today:

- * Automated systems execute constantly -- even in dangerous conditions
- * No regime awareness = capital erosion during volatility
- * Single-layer risk checks that fail under stress
- * Billions in preventable losses occur annually due to poor automated risk governance -- across trading, supply chain, lending, and insurance

The result: Costly mistakes are the norm, not the exception.

Most systems optimize for action. Nobody optimizes for restraint.

First domain: Digital asset trading. But the problem is universal -- any industry where decisions under uncertainty involve money at risk.

SLIDE 3 -- THE SOLUTION

OMNIX builds the governance layer for automated decision systems -- blocking costly mistakes before they happen.

Unlike systems that chase every opportunity, OMNIX operates as a fail-closed governance engine: if confidence falls below defined thresholds, action is automatically halted. The same 8-checkpoint entry + 3-gate exit governance architecture applies to any domain where decisions under uncertainty involve capital at risk.

Three Principles:

Principle	What It Means
Protection Before Action	Prevent losses before pursuing gains. By design.
Fail-Closed Architecture	Default = don't act. Must earn the right to execute.
Full Decision Auditability	Every decision -- executed or blocked -- is logged with complete rationale.

First vertical validated: Digital asset trading. The architecture is domain-agnostic -- the same engine governs decisions in trading, supply chain, lending, insurance, and compliance.

"Knowing when NOT to act is a stronger edge than forcing action."

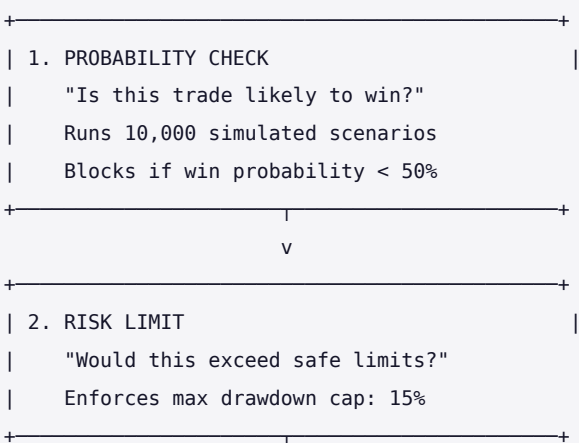

SLIDE 4 -- HOW IT WORKS (6 Security Checkpoints)

Think of it as airport security for every high-stakes decision.

Every decision must pass through 6 independent security checkpoints. If ANY checkpoint fails, the action is automatically blocked.

Trade Signal Arrives

|
v

ALL 6 must approve -- or the action is blocked.

Most systems have 1 risk check. OMNIX has 6 independent ones that must ALL agree. This architecture is domain-agnostic -- the same checkpoints govern trading decisions, procurement approvals, credit extensions, and compliance validations.

"Airport security doesn't let you through if one scanner fails. Neither does OMNIX."

SLIDE 5 -- THE TRADE THAT DIDN'T HAPPEN

This is our product working -- not failing.

Real Scenario: February 3, 2026 -- BTC Breakout

Market Conditions:

BTC Price Action: +6% in 2 hours
 Market Sentiment: Euphoric
 Traditional Bot: Would execute \$50,000 position

OMNIX Decision:

Checkpoint 1: Probability	→ PASS	✓
Checkpoint 2: Risk Limits	→ PASS	✓

OMNIX -- Decision Governance Infrastructure

Checkpoint 3: Signal Agreement→ PASS	✓	
Checkpoint 4: Trend Confirm	→ FAIL	✗
Checkpoint 5: Stress Test	→ WARNING	⚠
Checkpoint 6: Logic Check	→ PASS	✓
DECISION: ■ BLOCKED ■		
Reason: Insufficient trend persistence		
(momentum spike, not sustained edge)		

48 Hours Later:
BTC dropped -9%
Traditional bot loss: -\$4,500
OMNIX exposure: \$0

Capital Preserved: \$50,000

This is what "fail-closed" looks like in practice. The system identified that the breakout lacked persistence -- a classic trap that destroys capital.

"A traditional bot would have bought the hype. OMNIX waited -- and was right."

SLIDE 6 -- TRACTION & PROOF (This Is Real, Not Theory)

OMNIX has been running continuously since November 2025 -- in real market conditions.

Track Record Performance

CALIBRATION PHASE	OFFICIAL TRACK RECORD	NEXT PHASE
Nov 2025 - Jan 14, 2026 →	Jan 15 - Feb 13, 2026 →	Phase 2
119 test trades	30 days completed	Gradual profit
Risk engine calibrated	Capital preserved	optimization
6-layer veto tuned	System running 24/7	

Key Metrics

Metric	Value	Context
Capital Preserved	98.5%	During a period where BTC dropped 7.37%
Max Drawdown	1.5%	
Trades Blocked	47	Signals vetoed by governance engine (91% validated against subsequent 48h price action -- internal dataset)
Block Success Rate	91%	
		Blocked trades would have lost money

Decision Cycles Analyzed

670,000+

Shadow Portfolio learning engine

PQC-Signed Receipts

16,000+

Every	governance	decision
cryptographically signed		

System Uptime

95%+

Production (Railway), not test
environment

Execution Latency

~120ms

Measured, not estimated

What These Numbers Mean

While Bitcoin dropped 7.37%, OMNIX preserved 98.5% of capital. Of the 47 trades it blocked, 91% would have resulted in losses.

The system's restraint saved capital -- that IS the value proposition.

"We don't measure success by how much we made. We measure it by how much we didn't lose."

SLIDE 7 -- TECHNOLOGY MOAT (Why This Is Hard to Copy)

Six layers of defensible technology built over 3+ months of real-market operation:

Technology	Simple Explanation	Competitive Advantage
6-Checkpoint Governance Engine	5 independent AI models must agree before any action	No single model can override the system
Behavioral Memory System	Remembers patterns beyond recent data	Sees what other systems miss
Edge Confirmation Window	Requires trend persistence for 3 cycles -- not just a spike	Turns "preservation" into "patience"
Shadow Portfolio Engine	Tracks every vetoed decision to learn (670,000+ events)	The system learns from what it DOESN'T do
Post-Quantum Security	Cryptographically signed decision receipts (post-quantum architecture)	Operational today -- not roadmap
Multi-AI Orchestration	Gemini 2.5 Flash + GPT-4o + Claude Sonnet 4 with failover	Zero single-provider dependency
Execution Integrity	Every trade reconciled against real exchange fill data (Kraken)	No estimated data -- verified execution
Mathematical Audit	100% P&L reconciliation -- 119/119 trades verified	Every cent accounted for

All financial performance metrics are calculated from database-verified P&L including exchange fees. See Mathematical Audit Report.

"Every decision is logged, traceable, and reviewable. Full audit trail -- by architecture."

SLIDE 8 -- MULTI-VERTICAL VISION (Beyond Trading)

The same 8-checkpoint entry engine + EGL. Different domains. Same discipline.

OMNIX is not a trading bot -- it is a decision governance infrastructure. Digital asset trading is the first

OMNIX -- Decision Governance Infrastructure

vertical where the architecture has been validated in production.

The governance logic is designed as domain-agnostic: the inputs change, but the eight entry checkpoints -- data integrity (SIV), probability (Monte Carlo), risk limits (RMS), veto early return, signal agreement (Coherence Engine), adaptive coherence gate, backward trajectory (TCV), forward implication (FTI), and edge persistence (ECW) -- plus the 3-gate exit pipeline (EGL), apply identically to any high-stakes automated decision.

Stage	Vertical	Status
Now -- Validated	Digital Asset Trading	Production since Nov 2025
Year 2-3 -- Roadmap	Supply Chain, Lending/Credit	Architecture designed, demos live

Year 3+ -- Future	Insurance, Energy Trading	Market opportunity identified
-------------------	---------------------------	-------------------------------

"We deliberately go deep in one domain before expanding. Trading is the hardest test. If the governance engine works here, it works everywhere."

SLIDE 9 -- BUSINESS MODEL (B2B Decision Governance Infrastructure)

PRIMARY: B2B Decision Governance -- Licensing to Institutions

Customer Type	Use Case	Pricing
Prop Trading Firms (200+ in ADGM/DIFC)	Protect trader capital with automated risk gates	\$15K-35K/month
Trading Platforms (3Commas, NinjaTrader)	Risk-as-a-Service for their users	\$0.01-0.05/validation
Regulated Funds (MiCA compliance)	Audit trail + risk governance for compliance	\$100K+ annual license

How It Works for a Prop Firm:

Trader submits order
→ OMNIX Risk Gate validates in <100ms
→ APPROVE (with audit trail) or BLOCK (with full rationale)

Impact for the firm:

-40% drawdown events
100% audit compliance
Zero development cost (they license, not build)

SECONDARY: B2C SaaS -- Individual Traders (Post-Enterprise Validation)

Tier

Price

Pro

\$149/month

Full Risk Guardian, decision audit trail

Advanced

\$499/month

API access, custom veto configuration

Revenue Projections (Conservative)

Year	Focus	Revenue
Year 1	3 enterprise pilots + early SaaS	\$200K-400K
Year 2	5-8 enterprise licenses + SaaS growth	\$800K-1.2M
Year 3	Scale + geographic expansion (ADGM → EU MiCA)	\$2M+

"Institutions pay for what BLOCKS bad decisions, not for alpha."

License-based revenue. No tokens. No performance fees.

"Institutions are not asking if they need governance. They are asking how soon they can implement it."

SLIDE 10 -- MARKET OPPORTUNITY

The Numbers

Market	Size
Global crypto daily trading volume	\$2.3T+
Target serviceable volume	Institutional algorithmic segment (~5-10% of total volume)
Algorithmic trading market	\$18.8B (growing 12% CAGR)
Prop firms in ADGM/DIFC alone	200+
Platforms needing MiCA compliance (2025+)	2,000+
Year 1 target	3 enterprise pilots

The Gap Nobody Is Filling

Institutional-level governance frameworks are typically inaccessible to smaller trading operations. There is no accessible governance infrastructure for:

- * Prop trading firms that need to protect trader capital
- * Trading platforms adding risk governance for compliance
- * Regulated funds (ADGM, DIFC, MiCA) needing audit trails
- * Family offices entering crypto without institutional tools

- * Supply chain and lending operations needing automated risk controls

Why Now -- Two Forces Converging

1. Institutional capital is flooding into digital assets -- but without proper governance infrastructure
2. MiCA regulation (EU) + ADGM requirements -- platforms MUST have decision governance and audit trails

Multi-Vertical Market Expansion

Vertical	Addressable Market	Timeline
Digital Asset Trading (Current)	\$18.8B algorithmic trading	Now (validated)
Supply Chain Risk	\$3.2B supply chain analytics	Year 2-3
Credit / Lending Governance	\$7.4B credit risk management	Year 2-3
Insurance Underwriting	\$5.1B insurtech	Year 3+
Energy Trading	\$2.8B energy risk management	Year 3+

The market needs decision governance infrastructure. Not more trading signals.

The regulatory clock is ticking -- and OMNIX is ready.

SLIDE 11 -- WHY DUBAI & MENA

Strategic alignment with the region's vision:

Factor	Why It Matters
ADGM	World-class regulatory framework for digital assets
Sovereign capital	Actively deploying into fintech and AI
DIFC	Direct access to institutional investor network
Hub71	Applied -- pending response (innovation accelerator)
200+ prop firms	Immediate addressable market in the region
Geographic position	Bridge between Asia, Europe, and Africa
Investor sophistication	Capital allocators who value discipline over hype

OMNIX is built for regulated environments. The shift from "crypto wild west" to institutional-grade infrastructure is happening here first.

SLIDE 12 -- FOUNDER & TEAM

Harold Nunes
Founder & Product Architect

- * Built OMNIX solo from concept to production-running system -- using AI as a development force multiplier
- * Designed the 8-checkpoint entry governance engine + 3-gate exit pipeline (EGL), risk logic, AI orchestration, and full production infrastructure
- * Self-taught technologist with institutional finance discipline
- * Relocating to Dubai for ADGM ecosystem

Why Me:

I spent three months building this with personal capital. Lean, focused build. Governance-first architecture. The product was validated before seeking external capital. I chose the hardest domain first -- real-time financial markets -- because if the governance engine works here, it works everywhere. That is not theory. That is conviction backed by 670,000+ data points.

What One Founder Built:

Capability	Status
6-Checkpoint Governance Engine	Production -- 670,000+ evaluation cycles
Multi-AI Orchestration (3 providers)	Production -- zero single-provider dependency
Post-Quantum Cryptographic Signing	Production -- operational since Nov 2025
Shadow Portfolio Learning Engine	Production -- 670,000+ counterfactual events
Full Decision Audit Trail	Production -- 100% telemetry coverage
Interactive Governance Demos (3 verticals)	Live -- trading, credit, insurance

Current Structure:

- * Architecture, risk logic, governance, infrastructure, roadmap: Founder-built and founder-led
- * Lean architecture designed for scalability; AI-assisted development reduces burn while maintaining velocity
- * Ecosystem: Applied to Hub71 (pending), building network in ADGM/DIFC

Planned Hires (Post-Funding):

OMNIX -- Decision Governance Infrastructure

- * Senior Backend Engineer -- Enterprise API development (Month 1-2)
- * DevOps / Infrastructure -- Multi-tenant scaling (Month 2-3)
- * Business Development -- Enterprise pilot outreach (Month 3-4)

Why This Works:

- * The product already exists and runs 24/7 -- the hard part is done
- * \$500K raise includes 2-3 key hires to scale what works -- not to build what doesn't
- * Capital-efficient execution: zero burn before funding, all IP created with personal capital

SLIDE 13 -- THE ASK

Pre-Seed Round

Item	Details
Raising	\$500,000 USD
Equity	16.7%
Pre-Money Valuation	\$2.5M-\$3M

Valuation Justification

Factor	Evidence
Working product in production	3+ months running 24/7
Real validation data	670,000+ decision cycles analyzed

Defensible IP	8-checkpoint entry + EGL + Shadow Portfolio engine (36 ADRs)
---------------	--

Strategic timing	MiCA + ADGM convergence creating urgent demand
------------------	--

Market reference	Comparable infrastructure startups raised \$3M-\$5M at similar stage
------------------	--

Use of Funds

Category	Allocation	Purpose
Strategy & Risk Engine	35%	Refine algorithms, expand Shadow Portfolio learning

Dubai/ADGM Legal & Regulatory

25%

Company formation, regulatory
structure

Enterprise Infrastructure

20%

API for prop firms, security
certifications

Team & Operations

15%

2-3 key hires -- eliminating
key-person risk (Month 1-4)

Reserve

5%

Contingency

Milestones with Funding

Timeline	Milestone
Month 1	Complete track record, begin institutional outreach
Month 3	First enterprise pilot (prop firm or trading platform)
Month 6	ADGM regulatory structure complete
Month 9	3 paying enterprise clients
Month 12	Series A readiness with validated revenue metrics

The 60-Second Case

1. The problem is massive -- Billions in preventable losses annually from poor automated risk governance
2. The timing is perfect -- MiCA + ADGM mandating decision governance NOW
3. The product exists -- Not a slide deck. Running in production for 3+ months.
4. The approach is differentiated -- To our knowledge, no comparable infrastructure optimizes for restraint
5. The data is real -- 670,000+ evaluation cycles, 98.5% capital preserved, 91% block accuracy
6. The market is here -- Dubai/ADGM is the epicenter of institutional governance infrastructure
7. The vision scales -- Same engine, multiple verticals: trading, supply chain, lending, insurance

"Most decision systems ask: 'How do I maximize returns?'"

OMNIX asks: 'How do I make sure costly mistakes don't happen?'"

That question is worth \$500K to answer at scale."

90-SECOND PITCH SCRIPT

For oral presentation practice:

"95% of high-stakes decision systems ask: 'When should I act?'"

>

The right question is: 'When should I NOT act?'"

>

Billions in preventable losses -- every year -- across trading, procurement, credit, and insurance. Why? No institutional-grade decision governance.

>

OMNIX is a fail-closed AI governance platform. Think of it as airport security for every high-stakes decision. Every action must survive 6 independent checkpoints before execution. One failed check --

automatic block.

>

We validated this in the hardest domain first -- real-time financial markets. Real example: February 3rd. BTC breakout -- up 6% in two hours. Market euphoric. Traditional bots bought. OMNIX blocked -- trend not sustained. 48 hours later, BTC crashed 9%. Capital preserved: \$50,000.

>

670,000 evaluation cycles. 98.5% capital preserved. 91% of blocked actions would have resulted in losses. Running in production 24/7 for three months.

>

Our first market: prop trading firms, trading platforms, regulated funds. 200+ prop firms in ADGM and DIFC alone. But the same engine applies to supply chain, lending, insurance, and compliance.

>

We're raising \$500K to close 3 enterprise pilots in digital assets and begin multi-vertical expansion.

>

The best decision is often the one you don't make. That's what we build.

>

Questions?"

Timing: ~90 seconds

APPENDIX A -- DECISION TRACE (Live System Output)

Historical example from February 10, 2026 -- generated under the 6-checkpoint system validated through Feb 2026. Current system operates with 8 entry checkpoints + 3-gate EGL exit pipeline (added March 5, 2026).

```
{
  "timestamp": "2026-02-10T14:23:45Z",
  "symbol": "BTC/USD",
  "decision": "BLOCKED",
  "checkpoints": {
    "probability_check": {
      "win_rate": "48.7%",
      "expected_return": "-0.22%",
      "verdict": "FAIL"
    },
    "risk_limits": {
      "portfolio_exposure": "0%",
      "drawdown_status": "WITHIN_LIMITS",
      "verdict": "PASS"
    },
    "signal_agreement": {
      "consensus": "44%",
      "threshold": "45%",
      "verdict": "FAIL"
    }
  },
}
```

```
"trend_confirmation": {  
  "consecutive_cycles": "0/3",  
  "status": "WAITING",  
  "verdict": "FAIL"  
},  
"stress_test": {  
  "severity": "LOW",  
  "crash_probability": "12%",  
  "verdict": "PASS"  
},  
"logic_check": {  
  "contradiction_index": 62,  
  "threshold": 70,  
  "verdict": "PASS"  
}  
},  
"final_decision": "BLOCKED -- 3 of 6 checkpoints failed",  
"capital_preserved": "$47,500"  
}
```

Every decision OMNIX makes produces this output. Fully traceable. Fully auditable. Nothing hidden.

APPENDIX B -- KEY DOCUMENTS FOR DUE DILIGENCE

Document	Description
Executive Fact Sheet	System status and governance framework
Track Record Case Study	Day-by-day capital protection narrative
Shadow Portfolio Report	670,000+ counterfactual trade analysis
Architecture Decision Records	27 documented technical decisions (ADRs)
Execution Integrity Report	Kraken fill reconciliation -- real exchange data verification
Mathematical Audit Report	100% P&L reconciliation -- 119/119 trades verified
System State Manifest	Live configuration (JSON, machine-readable)

All documents available upon request for qualified investors.

OMNIX -- Governing Decisions Under Uncertainty
Eureka Dubai 2026 -- Semifinalist

Disclaimer: This document describes decision governance engine operation during a validation period using digital asset trading as the first vertical. All metrics are from decision engine operation in real market conditions. Past performance does not guarantee future results. OMNIX is decision governance infrastructure, not an investment product. Revenue projections are estimates based on conservative assumptions. Multi-vertical expansion timelines are projections, not commitments.
