

OMNIX -- Eureka GCC 2026 Pitch Script (Harold Nunes)

OMNIX Decision Governance Infrastructure | March 2026 | Confidential

OMNIX -- Eureka GCC 2026 Pitch Script

Harold Nunes | March 18, 2026 | 3-4 Minutes

Timing guide: 30s hook → 45s solution → 45s product → 30s market → 30s business → 20s close

1. Hook (20-30 seconds)

Every day, automated systems make decisions that move billions of dollars -- in trading, lending, insurance, and supply chains.

But most of these systems have one critical weakness.

They can execute decisions at machine speed -- but they have no governance layer capable of validating those decisions before execution.

And when automated systems fail, they do not fail slowly.

They fail at machine speed.

Cada día, los sistemas automatizados toman decisiones que mueven miles de millones de dólares -- desde trading y préstamos hasta seguros y cadenas de suministro.

Pero la mayoría de estos sistemas tiene una debilidad crítica.

Pueden ejecutar decisiones a velocidad de máquina, pero no tienen una capa de gobernanza que valide esas decisiones antes de ejecutarlas.

Y cuando los sistemas automatizados fallan, no fallan lentamente.

Fallan a velocidad de máquina.

2. Solution (30-40 seconds)

OMNIX solves this problem.

OMNIX is Decision Governance Infrastructure for automated systems.

Instead of generating trading signals or decisions, OMNIX sits between the decision system and execution.

Every decision must pass through eight independent validation checkpoints before it is allowed to execute.

If any checkpoint detects a risk, the system blocks the decision automatically.

This fail-closed architecture ensures that automated systems default to protecting capital -- instead of blindly executing.

OMNIX resuelve este problema.

OMNIX es infraestructura de gobernanza de decisiones para sistemas automatizados.

En lugar de generar senales o decisiones, OMNIX se coloca entre el sistema de decisiones y la ejecucion.

Cada decision debe pasar por ocho checkpoints independientes de validacion antes de ejecutarse.

Si alguno detecta riesgo, la decision se bloquea automaticamente.

Esta arquitectura fail-closed hace que los sistemas automatizados protejan el capital antes de actuar.

3. Real Product (45 seconds)

OMNIX is not a concept -- it is already running.

The system has been operating 24/7 in production since November 2025.

So far, the governance engine has completed 728,000+ decision evaluations and generated 50,000+ post-quantum cryptographically signed governance receipts.

Every decision is validated in under 120 milliseconds.

We also built a public verification system -- anyone can verify governance receipts at omnixquantum.net/verify -- without accessing internal data.

This creates a transparent and auditable decision layer for automated systems.

OMNIX no es un concepto -- ya esta funcionando.

El sistema lleva operando 24/7 en produccion desde noviembre de 2025.

Hasta ahora el motor de gobernanza ha realizado mas de 728,000 evaluaciones de decisiones y ha generado mas de 50,000 recibos firmados con criptografia post-cuantica.

Cada decision se valida en menos de 120 milisegundos.

Tambien creamos un sistema publico de verificacion en omnixquantum.net/verify -- donde cualquier persona puede verificar decisiones sin acceder a datos internos.

4. Market (30 seconds)

This problem exists across multiple industries.

We are starting with digital asset trading -- where automation is already dominant.

But the same governance engine applies to:

- * Credit and lending decisions

- * Insurance underwriting
- * Supply chain automation
- * Robotics and autonomous systems

Across these verticals, the combined addressable market exceeds \$49 billion.

Este problema existe en multiples industrias.

Comenzamos con trading de activos digitales -- donde la automatizacion ya es dominante.

Pero el mismo motor de gobernanza aplica a: credito, seguros, cadena de suministro, y robotica.

En conjunto, estos mercados superan los 49 mil millones de dolares.

5. Business Model (30 seconds)

OMNIX operates a B2B infrastructure model.

Enterprise clients license the governance engine for \$15,000 to \$35,000 per month, depending on scale and integrations.

High-volume platforms can also use a per-validation API model.

This pricing is significantly lower than the cost of building internal risk governance teams -- which often exceed \$1 million per year.

OMNIX opera con un modelo B2B de infraestructura.

Los clientes empresariales licencian el motor de gobernanza por \$15,000 a \$35,000 al mes.

Las plataformas de alto volumen tambien pueden usar un modelo por validacion via API.

Este precio es mucho menor que construir equipos internos de gestion de riesgo -- que suelen costar mas de un millon de dolares al ano.

6. Close (20 seconds)

Automated systems are becoming more powerful every year.

But power without governance creates systemic risk.

OMNIX ensures that when automated systems act -- they act with discipline.

Thank you.

Los sistemas automatizados son cada vez mas poderosos.

Pero el poder sin gobernanza crea riesgo sistematico.

OMNIX garantiza que cuando los sistemas automatizados actuan -- actuan con disciplina.

Gracias.

Note: After the final line, stay silent. Let the last phrase land.

Real data as of March 8, 2026 -- sourced from production Railway database.

728,868 total evaluations | 50,688 PQC-signed receipts | 8-checkpoint entry + 3-gate exit architecture (ADR-036)
