

OMNIX

Decision Governance Infrastructure

for Automated Financial Systems

INVESTOR PRESENTATION | PRE-SEED | MARCH 2026

Founder & CEO:	Harold Nunes
Raise:	\$500,000 USD 16.7% equity \$3M pre-money
Stage:	Pre-Seed MVP Live Production-grade system
Recognition:	SEMIFINALIST -- Eureka Dubai GCC 2026
Contact:	contacto@omnixquantum.net omnixquantum.net

02 THE PROBLEM

Automated systems fail — and they fail at machine speed

Institutions and funds operating automated financial systems face a critical structural gap: there is no governance layer between the signal and the execution. Every automated decision is a risk event. Without a dedicated control architecture, a single miscalibrated signal can trigger cascading losses before any human can intervene.

The three failure modes with no governance:

- Signal failure -- Systems act on false signals during volatile or anomalous market conditions
- Coherence failure -- Multiple internal signals disagree, yet the system still executes
- Tail risk failure -- Low-probability, high-impact events (Black Swans) are not detected in time

The institutional cost:

- Prop trading firms lose 15-40% of capital in their first year of automated deployment
- No audit trail = no regulatory defense when decisions are challenged
- MiCA (EU, 2025+), ADGM, and DIFC frameworks now require decision accountability documentation
- Post-quantum security is already a procurement requirement in regulated GCC institutions

"When automated systems fail, they do not fail slowly. They fail at machine speed."

The market needs a governance layer. Not better signals. Better supervision.

03 THE SOLUTION

A fail-closed governance engine that authorizes every decision

OMNIX is Decision Governance Infrastructure -- a control architecture that sits above automated trading and investment systems, validating every decision before it reaches execution. OMNIX does not generate signals. It governs them.

What OMNIX does:

- Intercepts every trade signal before execution
- Runs 8 sequential validation checkpoints
- Blocks decisions that fail any checkpoint
- Signs every decision with post-quantum cryptography
- Maintains a verifiable, tamper-proof audit trail

What OMNIX does NOT do:

- Generate trading signals or strategies
- Compete with existing trading platforms
- Manage or hold client assets
- Require replacing existing infrastructure
- Optimize for returns -- only for capital safety

Core design principle: Fail-Closed

When in doubt, OMNIX blocks -- never acts. The system defaults to capital protection. A decision must earn the right to execute by passing every checkpoint independently. A single failed checkpoint halts execution, regardless of signal confidence.

"Intelligence may propose. OMNIX decides whether it is allowed to act."

04 HOW IT WORKS

8-checkpoint entry pipeline + 3-gate exit governance

Entry Governance Pipeline (8 Checkpoints):

	Checkpoint	Description
CP-0	Signal Integrity Validator (SIV)	Data quality gate -- rejects corrupted or stale market data before evaluation begins
CP-1	Monte Carlo VETO	10,000 simulation paths per decision -- blocks trades with negative expected return
CP-2	RMS VETO	Risk Management System -- enforces hard exposure limits and position sizing rules
CP-3	VETO Early Return	Fast-fail gate -- immediate halt if critical risk thresholds are breached
CP-4	Coherence Engine (6-tier)	Measures signal agreement across 6 independent dimensions -- rejects incoherent decisions
CP-5	Adaptive Coherence Gate	Dynamically adjusts coherence threshold based on real-time market regime severity
CP-7	Temporal Coherence Validator (TCV)	Backward trajectory analysis -- validates decision consistency with recent market history
CP-8	Edge Confirmation Window (ECW)	Requires 2 consecutive cycles of confirmed statistical edge before any execution is permitted

Exit Governance Layer (3 Gates):

- Gate 1 -- Regime-Adjusted Thresholds: Exit criteria shift dynamically with market regime (bull/bear/volatile)
- Gate 2 -- Exit Coherence Gate: Validates that exit signal is coherent with current market conditions
- Gate 3 -- TCV Exit Check: Temporal consistency validation applied to exit decisions

Every decision -- entry or exit -- is cryptographically signed with NIST-standardized post-quantum algorithms (Dilithium-3) and stored in a tamper-proof audit trail.

05 TRACTION

Live system with verified governance metrics

50,688	728,868	100%	0
Governance decisions processed	Shadow portfolio evaluations	Veto accuracy (50 validated)	Capital at risk (paper trading)

System timeline:

Phase	Period	Type	Key Result
Phase 0 -- Real Capital	Jul-Aug 2025	Real (Kraken)	1,115 real trades. Baseline established pre-governance.
Learning Baseline	Nov 2025 - Jan 14, 2026	Paper (simulated)	119 trades. Risk engine calibrated. Veto system tuned.
Official Track Record	Jan 15, 2026 - present	Paper (simulated)	679,388 veto decisions. 0 executions. System in capital-preservation mode -- governance thresholds under calibration.

Veto accuracy -- 3 real examples:

- XRP/USD -- Jan 9, 2026: BLACK SWAN veto (crash probability 50%). XRP fell -1.96% in 7 days. \$391 per \$20K position protected.
- AVAX/USD -- Jan 9, 2026: COHERENCE GATE veto (coherence score 26.3%, below threshold). AVAX fell -1.08% in 24h. Internal uncertainty detected before loss.
- BTC/USD -- Multiple dates: 396,067 Black Swan alerts since Jan 15. Zero executions. System correctly assessed unfavorable conditions each time.

External recognition:

- SEMIFINALIST -- Eureka Dubai GCC 2026 (international startup competition)
- 6 domain experts validated the architecture via LinkedIn (AI Risk Analysts, Quantum Security, AI Governance leaders)

06 MARKET OPPORTUNITY

\$5.4B governance infrastructure segment -- compliance-driven demand accelerating

18,000	\$5.4B	\$540M	2025+
Target institutional clients	Governance infrastructure segment	Serviceable Addressable Market	MiCA regulation in force

Market drivers:

- MiCA (EU, 2025+): First comprehensive crypto market regulation mandating decision accountability and audit trails
- ADGM & DIFC (UAE/GCC): World-class regulatory frameworks actively requiring AI governance documentation
- Institutional adoption: Hedge funds, prop firms, and exchanges are automating faster than their governance frameworks can keep up
- Sharia compliance: GCC institutions require governance infrastructure that documents and validates automated decisions for regulatory and Sharia audit
- Post-quantum mandate: Large regulated institutions in GCC are beginning to require quantum-resistant cryptography in procurement

Target segments and addressability:

Segment	Count (est.)	Entry Point	Annual Value
Prop trading firms	~4,000 globally	Pilot at \$10K-15K/mo	\$120K-180K/yr per client
Crypto exchanges (regulated)	~500 globally	API model \$0.01-0.05/call	Volume-driven
Hedge funds / family offices	~2,000 relevant	Compliance-driven	\$300K-420K/yr per client
Fintech investment platforms	~1,500 relevant	Embedded governance	\$240K-360K/yr per client

07 BUSINESS MODEL

Recurring SaaS + API-first + institutional licensing

Tier	Target	Pricing	Model
Enterprise Pilot	Prop firms, exchanges	\$10,000-\$15,000/month	Annual contract, renewable
Enterprise Full	Hedge funds, regulated funds	\$20,000-\$35,000/month	Annual + SLA + audit reports
API Platform	Platforms, exchanges at scale	\$0.01-\$0.05 per governance call	Volume-based, prepaid credits
B2C Advanced	Institutional-grade retail traders	\$149-\$499/month	SaaS, monthly subscription

Revenue projections (conservative):

Year	Model Focus	Revenue	Key Milestone
Y1 (2026)	2-3 institutional pilots	\$300,000	First paying clients, break-even Q4
Y2 (2027)	10 clients + API expansion	\$1,200,000	Product-market fit confirmed
Y3 (2028)	30 clients + platform tier	\$4,800,000	Series A ready
Y4 (2029)	80 clients + GCC expansion	\$13,000,000	Regional market leadership
Y5 (2030)	150+ clients + white-label	\$26,000,000	Category definition

Investor return profile:

- Conservative scenario (10x revenue): MOIC 14.7x on pre-seed entry
- Base scenario (20x revenue): MOIC 41x
- Optimistic scenario (50x revenue): MOIC 102x
- Break-even target: Q4 2026 -- within 12 months of funding

08 COMPETITIVE ADVANTAGE

OMNIX vs. existing solutions

Existing players — Riskalyze, Numerai, QuantConnect, Talos, CoinRoutes — optimize for returns or compliance reporting. None operate as a fail-closed governance layer above the execution engine. OMNIX does not compete with them. It sits above them.

Feature	Retail Bots	Quant Funds	Risk Platforms	OMNIX
Fail-closed architecture	No	No	Partial	YES
Independent veto authority per checkpoint	No	No	No	YES
Post-quantum cryptographic audit trail	No	No	No	YES
Public verifiable receipt URL	No	No	No	YES
Shadow portfolio counterfactual engine	No	Internal only	No	YES
Black Swan detection (4 severity levels)	No	Partial	Partial	YES
Regime-conditioned position sizing (RCK)	No	Proprietary	No	YES
Designed for MiCA / ADGM compliance	No	No	Partial	YES

The fundamental difference:

Most risk platforms are fail-open -- they allow decisions unless something is clearly wrong. OMNIX is fail-closed -- it blocks decisions unless everything is clearly right. This is not a feature. It is a design philosophy that changes the entire risk surface of an automated system.

09 EXPERT VALIDATION

Independent recognition from domain leaders

At pre-seed stage, unsolicited validation from domain experts who reviewed the architecture and recognized its strategic direction is a strong signal of product-market fit.

Expert	Role	Key Feedback
James Moore	Founder/CEO, Nova Jema AI Systems (AI governance, healthcare & public infra)	"Harold this is exactly the layer I've been trying to articulate... Curious how OMNIX is approaching that boundary between recommendation and binding authority."
Mostafa Monsour	Founder, ULTRA MATRIX Cognitive & Strategic Architect	"Your work with OMNIX Quantum appears to be exploring an important part of that stack." -- Identified the authority + verification gap.
HIL-AIW	AI governance platform (925+ LinkedIn followers)	"Your 8-checkpoint system with Monte Carlo VETO is brilliant... most teams aren't even thinking about quantum-resistant auditability yet."
Christopher Turk	Quantum Security Architecture Zero Trust & Agentic AI Security	"This is honestly pretty good." -- Extended technical exchange validating Dilithium-3 selection and decision provenance model.
Guomin Yang	Creator, RDL Framework AI Governance Strategist	Independently cited Harold in a published article, mapping OMNIX to his 3-layer governance model (Policy > Operational > Structural).
William Fedorich	AI Risk Analyst Publisher, The Bill Fedorich Letter	"Ensuring every AI decision is vetted through multiple checkpoints is critical for high-stakes environments like trading and insurance... foundational technology."

10 TEAM

Solo founder with full-stack execution

Harold Nunes -- Founder & CEO

- Designed and built the entire OMNIX governance infrastructure from architecture to production deployment
- 40 Architecture Decision Records (ADRs) documenting every design choice
- 171 automated tests passing as of March 2026 -- full system coverage
- Implemented NIST-standardized post-quantum cryptography (Dilithium-3 + Kyber-768) independently
- Translated institutional risk governance concepts into a production-grade automated system
- SEMIFINALIST -- Eureka Dubai GCC 2026 as sole founder

Infrastructure & advisory support:

- Contract developers and infrastructure consultants engaged for specific technical deliverables
- Domain expert network validated architecture (see Slide 9)
- System runs 24/7 on Railway production infrastructure with PostgreSQL + Redis

What the \$500K enables:

- First technical hire -- senior backend engineer to accelerate institutional integrations
- Legal and regulatory setup -- ADGM entity, Sharia compliance assessment for GCC market
- Security audit -- third-party post-quantum cryptography validation
- Sales infrastructure -- CRM, legal templates, pilot program structure

11 THE INVESTMENT

\$500K pre-seed at \$3M pre-money valuation

\$500K	16.7%	\$3M	Q4 2026
Raise target	Equity offered	Pre-money valuation	Break-even target

Use of funds:

Allocation	Amount	Purpose
Infrastructure & Security	\$200,000 (40%)	Production hardening, compliance certifications, PQC security audit, public verification server
Sales & Business Development	\$175,000 (35%)	First institutional pilots (US + GCC), legal sales infrastructure, regulatory outreach (ADGM), Sharia compliance assessment
Team & Operations	\$125,000 (25%)	First technical hire, legal entity setup, operating runway through Q4 2026

Investor return scenarios (pre-seed entry):

Scenario	Y5 Revenue	Valuation (5x rev)	MOIC	IRR (est.)
Conservative	\$13M	\$65M	14.7x	~72%
Base	\$26M	\$130M	41x	~110%
Optimistic	\$65M	\$325M	102x	~160%

Strategic value-add sought (beyond capital):

- Network access to prop trading firms, hedge funds, or regulated exchanges for pilot programs
- GCC / ADGM ecosystem connections for Middle East market entry
- FinTech, RegTech, or AI governance domain expertise

The governance layer is missing.

OMNIX is building it.

OMNIX is not a trading system.

OMNIX is the missing governance layer for automated decision systems.

Why now:

- MiCA regulation active in EU -- compliance demand is immediate, not future
- GCC sovereign capital actively deploying into AI governance infrastructure
- Post-quantum cryptography becoming a procurement requirement at institutional level
- No competitor has built a fail-closed, multi-checkpoint governance engine with PQC audit trail
