Attachment: OMNIX-RTE-001-REVIEWER_20260528_085038.zip

Gregory,

Attached is OMNIX-RTE-001 v1.1.0 -- a runtime treasury execution trace for an autonomous cross-border liquidity release of USD 50,000,000 via SWIFT MT202 / XRPL.

The package covers the full governance chain twice: one path producing hard refusal (HALT, settlement blocked), one producing bounded admission (settlement released). Every artifact is PQC-signed (ML-DSA-65, FIPS 204) and verifiable offline without access to any OMNIX infrastructure.

The package includes a standalone verifier (single Python file, stdlib + optional pqc). We ran an internal adversarial review -- 15 attacks, 4 bypasses found in v1.0.0, all remediated. The current version passes 111 of 111 checks, 0 failures.

To verify:

```
unzip OMNIX-RTE-001-REVIEWER_20260528_085038.zip
cd OMNIX-RTE-001-REVIEWER
python verify.py
```

Interested in your read -- specifically whether you find anything the verifier should catch that it does not.

Subject: OMNIX-RTE-001 v1.1.0 ? Package ready for review
Date: May 28, 2026
Attachment: OMNIX-RTE-001-REVIEWER_20260528_085038.zip

Anamulla,

Attached is the OMNIX-RTE-001 v1.1.0 reviewer package -- our first complete dual-path execution trace for a USD 50,000,000 autonomous treasury scenario.

It shows the system blocking an inadmissible execution and admitting a compliant one, with every decision cryptographically signed and verifiable offline by anyone with a Python interpreter.

We ran an internal adversarial review before releasing this -- 15 attacks, 4 bypasses found and closed. The package passes 111 of 111 checks, 0 failures.

To verify:

```
unzip OMNIX-RTE-001-REVIEWER_20260528_085038.zip
cd OMNIX-RTE-001-REVIEWER
python verify.py
```

Sending this to a small number of reviewers. Let me know your read.
