

OMNIX -- Presenter Guide (Eureka GCC 2026)

OMNIX Decision Governance Infrastructure | March 2026 | Confidential

OMNIX -- Presenter Guide

Eureka GCC 2026 | March 18, 2026

For the person presenting on behalf of Harold Nunes.

Read this once before the event. Carry the Pitch Card (page 2) in your pocket.

PART 1 -- CHEAT SHEET (Read this before entering the room)

The Problem	Automated systems make high-stakes decisions without governance -- costly mistakes happen at machine speed.
The Solution	OMNIX is Decision Governance Infrastructure that validates automated decisions before execution.
Product Status	Running 24/7 since November 2025. Not a concept. A working system.
Key Numbers	740,000+ evaluations · 58,000+ post-quantum signed receipts · ~305ms latency
Market	\$49.7B across trading, lending, insurance, supply chain, robotics
Business Model	Enterprise licensing \$15,000 - \$35,000 per month
Core Advantage	Fail-closed governance + post-quantum cryptographic audit trail + production-validated system
Public Demo	Anyone can verify decisions live at omnixquantum.net/verify
The Ask	\$500,000 USD -- 16.7% equity -- \$3M pre-money valuation

PART 2 -- PITCH CARD (Print this. Carry it in your pocket.)

OMNIX -- Pitch Card

PROBLEM: Automated systems fail at machine speed.
No governance layer exists before execution.

SOLUTION: OMNIX sits between the decision system and execution.
8 independent checkpoints validate every decision.
If any fails → blocked automatically. Fail-closed.

PROOF: Live since Nov 2025. 740,000+ evaluations.
58,000+ decisions cryptographically signed.
Verify at omnixquantum.net/verify

MARKET: \$49.7B -- trading, lending, insurance, supply chain.

BUSINESS: \$15K-\$35K/month enterprise licensing.

THE LINE: "They're not paying for software.
They're paying for capital they don't lose."

ASK: \$500K · 16.7% equity · \$3M pre-money

PART 3 -- THE ONE SENTENCE THAT EXPLAINS EVERYTHING

"OMNIX is the governance layer that validates automated decisions before execution."

If you forget everything else -- say this sentence. It covers the whole project.

PART 4 -- KEY PHRASES TO USE (and avoid)

USE these words:

- * infrastructure
- * governance
- * capital protection
- * institutional
- * auditability
- * risk management
- * fail-closed
- * pre-execution validation

NEVER say these words:

- * ~~bot~~ -- makes it sound like a retail trading tool

- * ~~trading system~~ -- sounds like a strategy, not infrastructure
 - * ~~strategy~~ -- OMNIX doesn't generate strategies, it governs them
 - * ~~algorithm~~ -- too generic, too many negative associations
-

PART 5 -- THE 4 MOST LIKELY QUESTIONS

Q: "How many real trades vs simulations?"

"119 real trades validated execution. The 740,000+ cycles validated the governance logic. Think of it like a flight simulator -- the real flights prove it works, the simulations stress-test it at scale. Every result is verifiable at omnixquantum.net/verify."

Q: "Why would someone pay \$15K/month for this?"

"They're not paying for software. They're paying for capital they don't lose. One avoided flash crash event covers the annual contract."

Q: "You built this alone?"

"The founder worked with contract developers and infrastructure consultants. The system runs autonomously 24/7 -- it doesn't require anyone present to operate. 15% of this raise goes directly to hiring the first 3 engineers."

Q: "Why start with crypto?"

"Crypto is the harshest environment to validate governance -- 24/7, high volatility, millisecond execution. If it works here, it works anywhere. The same engine applies to lending, insurance, supply chain, and robotics."

Q: "The dashboard shows a loss of \$15,000 -- is the system losing money?"

"That number is the Learning Baseline -- November 2025 to January 14, 2026. Three important points: first, that is 100% virtual capital, paper money -- no real funds were ever at risk. Second, that period was deliberate calibration -- the system was learning the parameters, not operating with final settings. Third, the Official Track Record started January 15, 2026, with recalibrated parameters. That is the number that counts for performance evaluation. We show the baseline number publicly because institutional credibility requires full transparency -- including calibration periods."

PART 6 -- IF YOU GO BLANK

Say this and return to the pitch:

"Let me quickly summarize why this matters."

Then say: "Automated systems are making high-stakes decisions without governance. OMNIX is the infrastructure layer that fixes that."

That gets you back on track every time.

PART 7 -- DEMO (if a judge asks)

"You can verify governance receipts publicly at omnixquantum.net/verify -- without accessing any internal data. The system is live right now."

Do not try to demonstrate anything else. That URL is enough.

PART 8 -- CLOSING INSTRUCTIONS

When the pitch ends:

1. Say: "Thank you."
2. Stop talking.
3. Do not add anything.

The silence after the last line is intentional. It lets the message land.

Last line of the pitch:

"OMNIX ensures that when automated systems act -- they act with discipline."

Say it. Then stop.

PART 9 -- TONE GUIDE

Do this	Not this
Calm and confident	Nervous or defensive
"The system is already running"	"We plan to build..."
"740,000 evaluations validated this"	"We believe this works"
Short sentences	Long explanations
Pause after key numbers	Rush through data

You are not defending the project. You are informing the judges about something that already exists.

OMNIX -- Governing Decisions Under Uncertainty

Eureka GCC 2026 -- Semifinalist
