Eureka Dubai GCC 2026 — Semifinalist Program Requirement

Prepared for:	Andrés Yie
Role:	CIO Digital Transformation & Data Analytics
Organization:	GHL Hoteles
Location:	Bogotá, D.C., Colombia
Date:	February 2026

Dear Andrés,

Thank you very much for your willingness to collaborate. I truly appreciate it.

I am currently a semifinalist in the **Eureka Dubai GCC 2026** program, and one of the requirements is to validate the problem and the proposed solution with industry professionals. Since we are still in an early stage and do not have active customers, the program requires honest feedback from leaders with real experience in operations and technology.

To give you clear context before the questions:

What is OMNIX?

OMNIX is a **validation and governance infrastructure for automated decisions**.

It is not another AI model. It is a control layer that sits **before** an automated decision is executed.

Its function is to:

- Validate rules before execution
- Block actions that do not meet defined criteria
- Record in a structured way what happened
- Allow precise reconstruction of decisions for future audits

The approach is especially designed for environments where an automated decision can generate:

- Operational risk
- Legal exposure

- Financial impact
- Compliance issues

The core idea is to **reduce the risk associated with the growing automation in critical systems.**

Validation Questions

Below are some questions that will help us validate whether this problem is real from a technology leadership perspective:

1. From your experience as CIO, do you consider that automation and AI are increasing exposure to operational or compliance risk in organizations?
2. When an automated system makes a critical decision, how easy is it to precisely reconstruct what happened and why it happened months or years later?
3. Have you seen cases where the lack of traceability in automated decisions has led to complex audits, internal problems, or reputational impact?
4. Do you believe most organizations today design their systems with potential future legal disputes in mind?
5. Would you consider it valuable to have an infrastructure that validates decisions before they are executed and leaves a structured, verifiable record?
6. In which industries or areas do you see the greatest urgency for this type of solution?
7. Do you believe regulated companies would be willing to allocate budget to reduce legal and operational risk associated with automated decisions?
8. What would be the first thing you would evaluate before adopting a solution like this?

OMNIX in Action — Interactive Demos

So you can see how the 6-checkpoint governance engine works across different industries, here are our interactive demos:

Credit / Lending Governance

Credit risk evaluation with 6 independent checkpoints

<https://www.omnixquantum.net/governance-demo>

Insurance Governance

Policy and claims evaluation with multi-layer validation

<https://www.omnixquantum.net/governance-demo-insurance>

Energy Trading Governance

Energy trading decision evaluation (natural gas, crude oil, solar, wind, LNG, electricity)

<https://www.omnixquantum.net/governance-demo-energy>

Public Governance Receipt Verification

Every decision governed by OMNIX generates a cryptographically signed receipt using **Dilithium-3** (post-quantum cryptography, NIST-standardized algorithms). These receipts are publicly verifiable:

Governance Metrics (Public API):

<https://omnibotgenesis-production.up.railway.app/api/governance/metrics>

Institutional Website

<https://www.omnixquantum.net>

Telegram Bot — OMNIX Decision Governance

You can interact directly with the governance system through our Telegram bot, where you will be able to see real-time analysis and how the 6-checkpoint engine evaluates each decision:

https://t.me/omnixglobal2025_bot

Thank you very much for your time and your honesty.
Your responses are key to completing the program's validation process.

Best regards,

Harold Nunes
